

WHAT YOU
NEED TO KNOW

about

LUPUS

Find out at a Community Education Session

GET INFORMED

Affecting millions worldwide yet often misdiagnosed, lupus is a complex autoimmune disease in which the immune system attacks rather than protects the body. Common symptoms include severe fatigue, joint pain, rashes and unexplained fevers. Women of color between ages 15-45 are at greatest risk. You or someone you know may have lupus and may need to see a doctor for a diagnosis.

Join this community event to learn more about what lupus is,
how it's diagnosed and how it can be managed.

This presentation was developed by the Lupus Research Alliance in collaboration with the National Minority Quality Forum and is being led by a volunteer.
